Copied to: Dr. Valentin Ilyashenko
Russian Federation Commissioner
to the International Whaling Commission (IWC)
7 July 2010
SUBJECT: Western Gray Whales and the potential impacts of Lebedinskoe seismic survey

Dear Sir

We, the Governments and scientists of Australia, Austria, Belgium, France, Germany, Hungary, Mexico, Monaco, New Zealand, United Kingdom and the United States would like to thank the Government of the Russian Federation for its work to address the critically endangered Western Gray Whale (WGW) in the west Pacific Ocean and for the continued efforts to mitigate potential impacts on this population from oil and gas development.

We note the planned seismic survey scheduled for July 2010 off Sakhalin Island this year, coinciding with the critical period in the Western Gray Whales feeding season, and we welcome consideration of its postponement in line with the advice from the International Whaling Commission's (IWC) Scientific Committee and the International Union for Conservation of Nature (IUCN) Western Gray Whale Advisory Panel (WGWAP).

Only around 130 Western Gray Whales remain with a minimum of just 26 breeding females observed since 1995. A 3-D seismic survey (Rosneft Lebedenskoie) is scheduled to take place when the highest number of gray whales, including mothers and their calves, are present in the area. We understand that the survey will last through much of the critical time when calves are with their mothers.

The IWC Scientific Committee, at their June 2010 meeting, were "extremely concerned about the potential impact of this survey on Western Gray Whales" and strongly recommended that "Rosneft postpone their survey until at least June 2011". The Committee also recommended that "Rosneft use monitoring and mitigation measures similar to those used by Sakhalin Energy, which have been independently reviewed by experts, and that all energy companies operating in the feeding areas of 2

WGW should use comprehensive monitoring and mitigation measures to protect them."

The WGWAP is "extremely concerned that the Lebedinskoe survey, without the kind of robust mitigation and monitoring planned for the Astokh survey, could seriously damage the survival and recovery of Western Gray Whales" and concluded that "postponement of the Lebedinskoe survey until at least 2011 is necessary and appropriate."

We note with concern the critically endangered status of this population and welcome range states and companies continuing to engage with the Western Gray Whale Advisory Panel and the IWC Scientific Committee to look at ways to mitigate anthropogenic disturbance to this population.

Yours Donna Petrachenko
