

Til Sundhedsministeren, ministeriet samt Folketingets Sundhedsudvalg
Cc: Statsministeriet Island, mfl.

I forlængelse af tidligere fremsendte; nedenfor yderligere og nylige advarsler vedr. TG fra "*Psychology Today*" og "*Scientific American*"

"What kind of story do these research findings outline about the parasitic behavioral manipulation and zombifying potential of *T. gondii*? To hear Flegr tell it, while human beings aren't currently under significant threat of being eaten by cats, we were from a historic and evolutionary perspective. Therefore, as intermediate hosts, **our brains are changed by *T. gondii* in a way that might have put us at greater risk of being eaten by something like a lion.** In the modern world outside of the savanna, those same brain changes might now place us at greater risk of mental illness, suicide, or death by car accident. **Flegr has suggested that *T. gondii*'s influence on human behavior is profound and that it could even be responsible for more human deaths than malaria** (usually considered to be the most deadly parasite on the planet)." <https://www.psychologytoday.com/blog/psych-unseen/201509/fear-the-walking-dead-can-brain-parasites-make-us-zombies>

"How a Cat Parasite Controls Other Animals' Brains. *Toxoplasma gondii*, an insidious and common parasite spread by cats, controls its rodent host's brain—**and may be manipulating our own behavior as well**" http://www.scientificamerican.com/article/how-a-cat-parasite-controls-other-animals-brains/?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed%3A+sciam%2Fhealth-and-medicine+%28Topic%3A+Health%29

Danske borgere - voksne som børn, mænd som kvinder - bliver syge af TG.
Dette faktum har stået klart i meget lang tid.
TG er farlig, TG kan og skal fjernes og behandles.

Med venlig hilsen
Bo Hembæk Svensson et al.
